PETN	pentaerythritol tetranitrate
PL	Permit Limit
QA	quality assurance
Qal	Quaternary Age alluvium
QC	quality control
RDX	hexahydro-1, 3, 5-trinitro-1, 3, 5-triazine (also cyclo-1, 3, 5-trimethylene 2, 4, 6-trinitramine)
RL	reporting limit
SL	statistical test limit
STLC	soluble threshold limit concentration
SVOC	semi-volatile organic compound
TATB	2, 4, 6-trinitro-1, 3, 5-benzenetriamine
TCE	trichloroethene (trichloroethylene)
TIC	tentatively identified compound
Tnbs ₁	Tertiary Age, Neroly Formation Lower Blue Sandstone (the regional aquifer)
Tnbs ₂	Tertiary Age, Neroly Formation Upper Blue Sandstone
Tnsc ₁	Tertiary Age, Neroly Formation Lower Siltstone/Claystone
TNT	2, 4, 6-trinitrotoluene (also 2-methyl-1, 3, 5-trinitrobenzene)
VOC	volatile organic compound
WDR	Waste Discharge Requirements (Permit)

EXECUTIVE SUMMARY

This report contains the elements required by Waste Discharge Requirements (WDR) 96-248 (Permit) for the combined 2005 fourth quarter and annual report. This is the tenth annual report prepared under this Permit and the last report that will contain data on the Class II surface impoundments (surface impoundments). LLNL completed clean closure of the surface impoundments on November 3, 2005. Compliance monitoring networks discussed in the report include:

- Process wastewater discharged into the surface impoundments (in **Section 2.2**)
- Leak detection monitoring (including leachate collection and removal system monitoring, and ground water monitoring) for the surface impoundments (in **Section 2.3**)
- Wastewater monitoring for the sewage evaporation and percolation ponds (in **Section 3.2**)
- Ground water monitoring for the sewage evaporation and percolation ponds (in **Section 3.3**)
- Observations at the percolation pits (in **Section 4.0**).

The annual report elements are incorporated into this annual / fourth quarter report. Brief narrative summaries of each compliance network lead each section. These narrative summaries discuss compliance issues and significant incidents that occurred during 2005. Annual summaries of monitoring data are presented in graphical and tabular form in **Appendices A, B, C, and D**. Methods used to determine statistical test limits (SLs) for ground water constituents of concern (COCs) are summarized in **Appendix E**. Fourth quarter quality assurance and quality control (QA/QC) data are summarized in **Appendix F**.

All discharges into the surface impoundments were in compliance with the Permit during 2005. Discharges into the surface impoundments were discontinued after the second quarter in preparation for clean closure of the surface impoundments that was achieved in November 2005.

No liquids were discovered in the leachate collection and removal systems (LCRS) during weekly monitoring.

Required ground water monitoring parameters for the surface impoundments were below the specified SLs throughout 2005, except as identified in **Table 1**.

Table 1. COC concentrations confirmed as exceeding their SLs in 2005.

COC exceeding SL (confirmed by retest)	Down gradient Wells		
	W-817-02	W-817-03	W-817-04
Ammonia	1 st quarter ^a (1/27/2005) ^b	3rd quarter ^a (1/27/2005) ^b	1 st and 3 rd quarters ^a (1/24/2002) ^b
Manganese	Did not exceed SL	Did not exceed SL	3rd quarter (7/2/2001) ^b

^a Ammonia was also detected in the field blank samples. (See also Brown 2005a & Brown 2005b)

^b Date of original letter report to the CVRWQCB.

Because sporadic detections of ammonia had occurred in ground water samples collected from up gradient well W-817-01 and from the three down gradient wells since 2001, LLNL had proposed a new SL of 0.080 mg/L for the down gradient monitor wells in 2002 (Brown 2002). Concentrations of ammonia have remained below that proposed SL, except for occasional spikes.

Concentrations of dissolved manganese have been observed sporadically above the SL of 0.01 mg/L in down gradient monitor well W-817-04 since the second quarter of 2001. The concentrations of dissolved manganese have remained consistent with the SL of 0.036 mg/L that LLNL proposed in 2002 (Brown 2002) and remain below that SL.

Monitoring data indicated compliance with the limits for the wastewater at the sewage evaporation and percolation ponds. None of the permitted mechanical equipment percolation pits overflowed during 2005.

During the review and preparation of the annual report, LLNL staff identified some irregularities with data from the sewage ponds ground water network that were not discovered during the preparation of the 2005 first and third quarter reports for this network. We discovered additional data points that were not previously reported. Some of these data indicate positive detections of fecal and total coliform in the samples from two wells. LLNL has initiated corrective actions, including immediately collecting ground water samples from suspect well W-26R-11. Neither fecal nor total coliform bacteria were detected in the samples collected from either of these two wells in the first quarter of 2006 (see Table 2), indicating that the first quarter 2005 results were either not characteristic of the ground water, or indicated at worst a transient effect that was not seen in other down gradient monitor wells.

Table 2. Coliform bacteria analytical results from two sewage pond wells, 2005 - 2006.

Well	Sample date	Fecal coliform (MPN^a/100 mL)	Total coliform (MPN/100 mL)
W-35A-04 (cross gradient)	23-Feb-05	5.1	12
	1-Mar-05	1.1	1.1
	2-Mar-05	<2	2
	4-Aug-05	<2	<2
	25-Jan-06	<2	<2
W-26R-11 (down gradient)	8-Feb-05	<1.1	<1.1
	9-Feb-05	23	23
	2-Aug-05	<2	8
	19-Jan-06	<2	<2
	21-Feb-06	<2	<2

^a MPN = Most probable number (of organisms).

1.0 Introduction

This report satisfies the 2005 fourth quarter and annual monitoring and reporting requirements of the Central Valley Regional Water Quality Control Board's (CVRWQCB's) Waste Discharge Requirements 96-248 (the Permit). It details the results of compliance monitoring networks in the Explosives Process Area and the General Services Area and visual observations at a third percolation pit system at the Experimental Test Site (Site 300).

The Explosives Process Area compliance network monitors ground water beneath, and process wastewater influent discharged into, two connected Class II surface impoundments where the process wastewater is evaporated. The General Services Area network monitors ground water beneath, and wastewater discharged into, the sewage evaporation and percolation ponds (sewage ponds) where sanitary waste is treated. The percolation pit network entails visual monitoring of five percolation pits that receive mechanical equipment wastewater.

Site 300, operated by LLNL, is located in the Altamont Hills approximately 13 kilometers (8 miles) southwest of the city of Tracy, California. **Figure 1** shows the locations of the surface impoundments within the Explosives Process Area and of the sewage ponds in the General Services Area of Site 300.

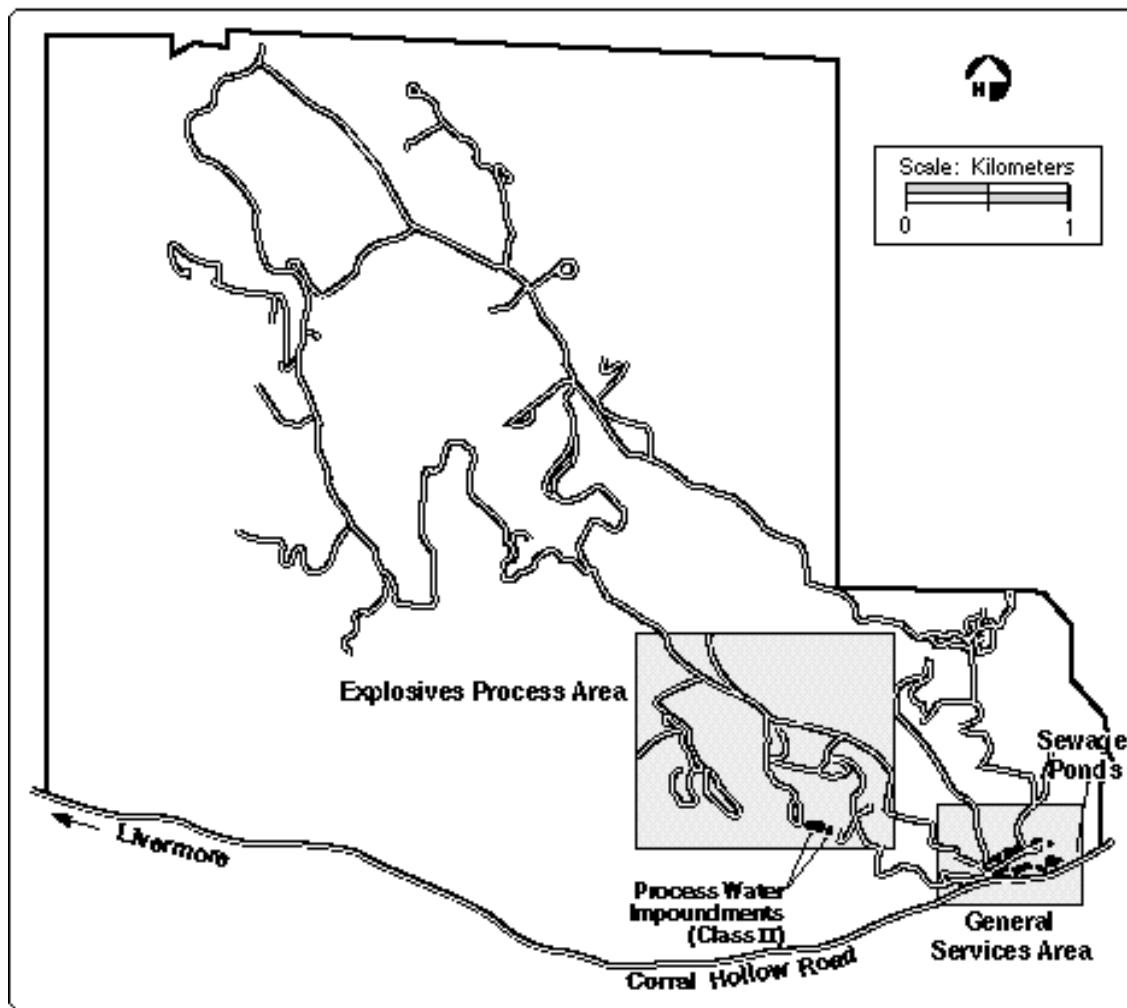

2.0 Class II Surface Water Impoundments

2.1 Compliance Monitoring Program

The Monitoring and Reporting Program in the Permit as modified in 1998 (MRP 96-248, Revision 1) specifies the required environmental monitoring for operation of the surface impoundments (Cohen 1998). These specifications include monitoring of process wastewater discharges to the surface impoundments and leak detection systems.

Process wastewater discharged to the surface impoundments was monitored for constituents found (or likely to be found) in materials used in operations conducted at buildings discharging to the surface impoundments. The monitoring program included collecting and analyzing samples from: photographic process rinse water from Building 823 (**Table A-1**) (wastewaters from retention tanks at Buildings 801, 850, and 851 were not discharged into the surface impoundments in 2005); chemistry wastewater from Buildings 825, 826, and the Building 827 Complex (827A, 827C/D, and 827E) (**Tables A-2.1 through A-2.4**) and explosives process wastewater from Buildings 806/807, and 817 (**Tables A-3.1 and A-3.2**). All discharges to the surface impoundments were discontinued in the third quarter of 2005; all wastewaters from those processes are now evaporated in permanent tanks.

Leak detection system monitoring includes monitoring of the leachate collection and removal systems (LCRSs) and ground water. LCRSs installed between the clay liners of the surface impoundments were inspected weekly for the presence of moisture that might indicate a leak in the HDPE liner.

CPA.D-9T-0001

Figure 1. Location of Class II surface water impoundments and sewage evaporation and percolation ponds.

Ground water samples were collected quarterly from monitor wells located up gradient and down gradient of the surface impoundments (**Figure 2**). Ground water analytical results are compared with statistical test limits (SLs) to identify statistical evidence of a release of chemicals into the ground water from the surface impoundments.

The four ground water monitor wells are screened in the Tertiary Age, Neroly Formation Upper Blue Sandstone (Tnbs₂). The direction of ground water flow is approximately southeasterly. Monitor well W-817-01 is hydrologically up gradient of the surface impoundments, and monitor wells W-817-02, W-817-03, and W-817-04 are down gradient. LLNL collects ground water samples quarterly from these monitor wells and analyzes them for the COCs specified in MRP 96-248, Revision 1 (Cohen 1998).

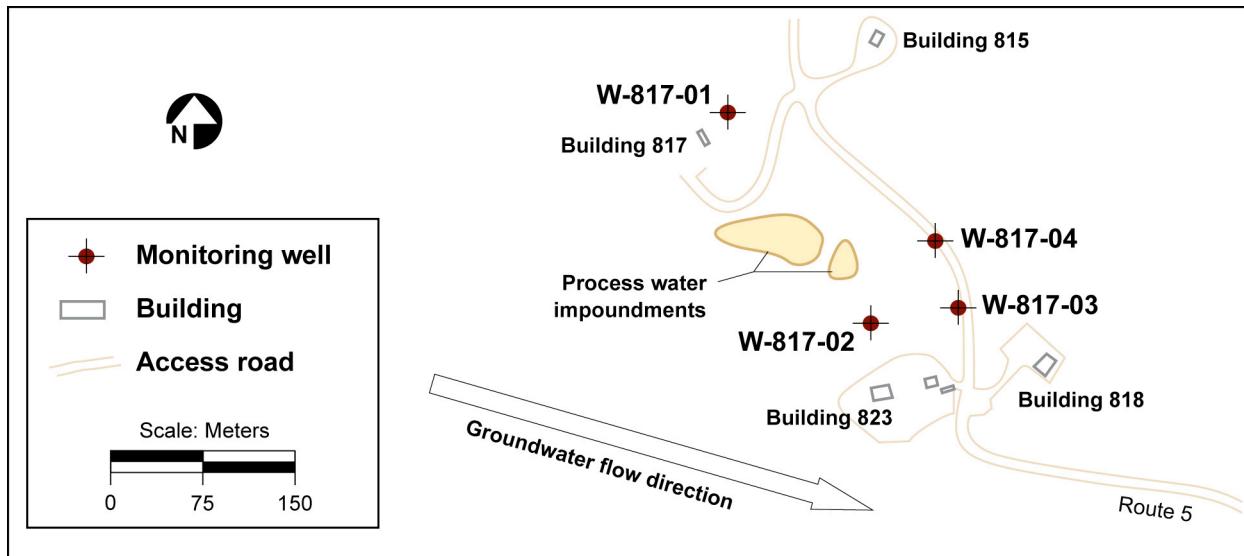

Figure 2. Site 300 Explosives Process Area ground water compliance monitoring locations.

2.2 Process Wastewater Monitoring Network

Data discussed in this section are provided in both graphical and tabular form in **Appendix A (Table A-1)** for all 2005 data discharged into the surface impoundments (through the second quarter).

2.2.1 Photographic Process Rinsewater Discharges

Photographic process rinsewater from the Building 823 retention tank was discharged automatically to the surface impoundments through the second quarter of 2005. This waste stream was sampled and analyzed once in the first quarter and once in the second quarter to verify that discharges were consistent with the effluent limits specified in the Permit.

All discharges into the Class II surface impoundments from Building 823 were in compliance with the effluent limits during 2005. Metals concentrations in all process rinsewater discharges sampled from retention tanks were in compliance with the Permit's effluent limits during 2005. Historical data for the COCs are plotted in **Appendix A**, and the 2005 analytical results are tabulated in **Table A-1**.

2.2.2 Chemistry Area Wastewater Discharges

Process wastewater generated from the Chemistry Area (Buildings 825, 826, and the Building 827 Complex) was held in retention tanks until evaluation of the analytical results from the samples collected indicated compliance with the Permit's effluent limits. Data were reported for the quarter when the discharge to the surface impoundments occurred, although wastewater samples may actually have been collected in an earlier quarter.

All process wastewater discharges from the Building 827 Complex occurred in the second quarter, and all constituent concentrations were in compliance with the effluent limits. No discharges occurred from the retention tanks at Buildings 825, 826, or 827A during the year. Analytical results for the Chemistry Area wastewater discharges from Buildings 827C/D, and 827E including COCs and additional analytes are presented in **Tables A-2.1, A-2.2, A-2.3, and A-2.4**. Historical data plots are included in **Appendix A**.

2.2.3 Explosives Process Area Wastewater Discharges

Wastewater generated from the Explosives Process Area (Buildings 806/807, 809, and 817) was sampled annually in accordance with MRP 96-248, Revision 1 (Cohen 1998).

The concentrations of COCs in process wastewater discharges sampled during 2005 from the Explosives Process Area were in compliance with the effluent limits. Process discharges associated with Buildings 806/807 were sampled once during the second quarter, and discharges associated with Building 817 were also sampled once during the second quarter. There were no discharges associated with Building 809; there have been no processes operating at Building 809 since construction activities began there in May 2001. Although construction has been completed, Building 809 remains offline until the final certification for the new isostatic press and ovens is complete. Annual analytical results of Explosives Process Area wastewater discharge samples are presented in **Tables A-3.1** and **A-3.2**. Historical data plots are included in **Appendix A**.

2.3 Leak Detection Monitoring Network

2.3.1 Leachate Collection and Removal Systems Monitoring

The two LCRSs were monitored weekly for liquids that would indicate a leak in a surface impoundment liner until they were demolished in the third quarter. Monitoring continued through August 2, 2005, after which the demolition work began to remove the sludge and HDPE liner. No liquid was discovered in these systems.

2.3.2 Ground Water Monitoring

In 2005, the concentrations of two COCs exceeded the respective SLs: ammonia as nitrogen in samples collected from wells W-817-02 and W-817-04 during the first quarter (Brown 2005a), and from wells W-817-03 and W-817-04 during the third quarter; and dissolved manganese in a sample collected from well W-817-04 during the third quarter (Brown 2005b). Concentrations exceeding the SLs were confirmed by at least one retest sample from each well.

LLNL has previously proposed updated SLs for ammonia (0.080 mg/L) in all wells, and for dissolved manganese (0.036 mg/L) in well W-817-04 in Brown 2002. Concentrations of ammonia were not confirmed as exceeding the proposed SL of 0.080 mg/L in any well, nor were concentrations of dissolved manganese confirmed as exceeding the proposed SL of 0.036 mg/L. LLNL believes these concentrations are just natural variations of background, and does not believe these elevated concentrations of either COC (**Table B-1.1**) originated from the surface impoundments.

Concentrations of the plasticizer compound bis(2-ethylhexyl)phthalate were detected at concentrations just over the SL of 5 µg/L in ground water samples collected from two down gradient wells during the second, third, and fourth quarters. This common laboratory contaminant was also detected, at estimated concentrations of 1.7 to 4.7 µg/L, in method blank and field blank samples during those quarters (**Tables F-1** and **F-2.1**).

Fourth Quarter

Table B-1.2 lists all ground water analytical results, including retest sample results, for the fourth quarter of 2005 for COCs under MRP 96-248, Revision 1 (Cohen 1998).

Analytical results from other parameters analyzed in water samples from these wells, which are not required by MRP 96-248, Revision 1, but are part of the analytical laboratory suites, are listed in **Table B-2.1**. **Appendix E** provides a brief description of all statistical methods used to evaluate compliance with the limits established in MRP 96-248, Revision 1 (Cohen 1998). A discussion of the fourth quarter ground water QA/QC data is provided in **Appendix F**, along with the field QA/QC data tables (**Tables F-1.1** and **F-1.2**).

The concentrations of acetone and 2-butanone (methyl ethyl ketone) reported in ground water samples collected on October 11, 2005, from down gradient well W-817-04 were 18 and 810 µg/L, respectively. These concentrations exceeded the respective SLs of 10 and 20 µg/L (**Table B-1.1**). Concentrations exceeding the SLs were not confirmed by results of the retest samples collected from that well on November 11 and 22, 2005 (**Table B-1.2**).

Concentrations of the energetic compound pentaerythritol tetranitrate (PETN) detected in ground water samples collected from down gradient monitor wells W-817-02 (2.35 µg/L) and W-817-04 (2.25 µg/L) in the fourth quarter exceeded the SL of 1.0 µg/L. These concentrations exceeding the SL were not confirmed by retest sample results (**Table B-1.2**). Plots of all COC data over time and tabular annual summaries of the ground water analytical data are included in **Appendix B**.

3.0 Sewage Evaporation and Percolation Ponds

3.1 Compliance Monitoring Program

Monitoring at the sewage evaporation pond (evaporation pond) and the sewage percolation pond (percolation pond) (**Figure 3**) is also specified in the MRP 96-248, Revision 1 (Cohen 1998). Applicable reporting requirements are detailed in the Permit (CVRWQCB 1996).

Quarterly samples of wastewater flowing into the evaporation pond are collected for analysis from a location west of the pond (sampling location ISWP in **Figure 3**). ISWP is a manhole that captures all waste streams before they flow into the pond. The samples are analyzed for electrical conductivity (EC), pH, and biochemical oxygen demand (BOD).

Quarterly wastewater samples are collected from the evaporation pond (sampling location ESWP) and analyzed for pH, EC, and dissolved oxygen (DO). Observations of the pond are made at least monthly for freeboard, color, odor, and levee condition. Any discharge from the evaporation pond to the percolation pond (sampling location DSWP) is sampled and analyzed for BOD, EC, total and fecal coliform, and pH.

Leak detection monitoring at the sewage ponds is accomplished by monitoring the shallow ground water, including the regional aquifer ($Tnbs_1$) beneath and adjacent to the ponds. Ground water monitoring includes semiannual sampling and analysis of the collected

samples. **Table 2** lists each monitor well; and whether it is up gradient, down gradient, or cross gradient of the sewage ponds; and the geological interval(s) over which it is screened. **Figure 3** shows the location of each of the wells.

Table 2. Monitor well location relative to sewage ponds and aquifer monitored.

Monitor well	Location	Screening interval
W-7E	Up gradient	Tnbs ₁ /Tnbs ₁
W-7ES	Up gradient	Qal/Tnsc ₁
W-7PS	Up gradient	Qal
W-35A-04	Cross gradient	Qal
W-26R-01	Down gradient	Tnbs ₁
W-26R-11	Down gradient	Qal
W-26R-05	Down gradient	Qal/Tnbs ₁
W-25N-20	Down gradient	Qal/Tnbs ₁
W-7DS	Down gradient	Qal/Tnbs ₁

Note: Tnbs₁ is the regional aquifer.

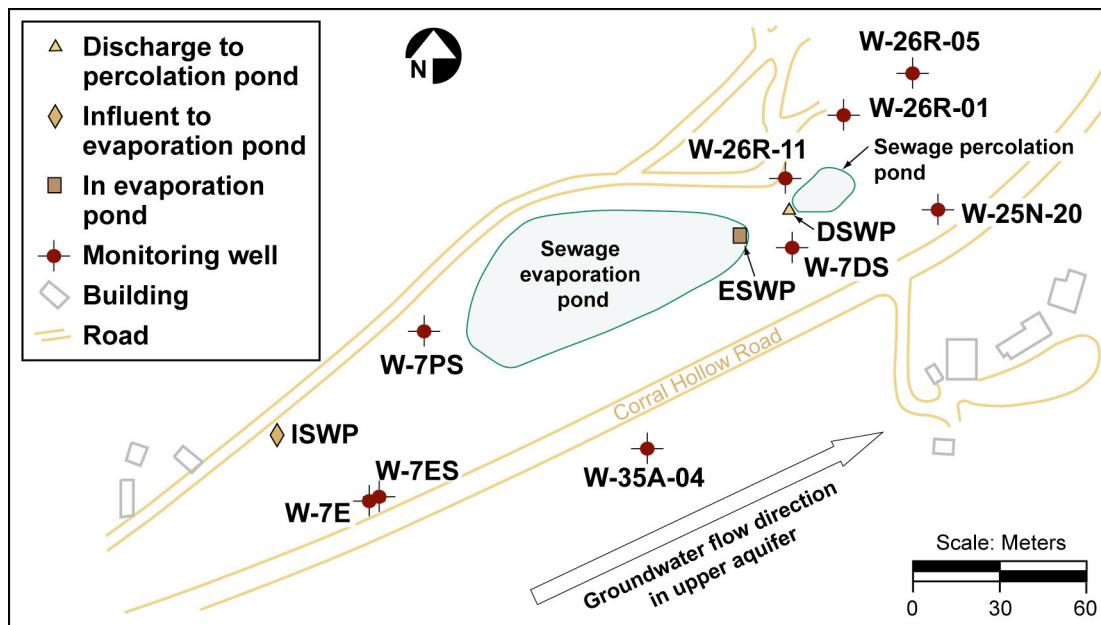

Figure 3. Site 300 sewage pond ground water and surface water compliance monitoring locations

3.2 Wastewater Monitoring

All required wastewater monitoring parameters for the sewage ponds were in compliance with the Permit's provisions and specifications throughout 2005. Continuous discharge occurred during the first quarter (**Table C-4**) from the evaporation pond to the percolation pond (Brown 2005a). Historical plots and tabular summaries of the 2005 data are included in **Appendix C**.

3.3 *Ground Water Monitoring*

During the review and preparation of the annual report, LLNL staff identified some irregularities with data from the sewage ponds ground water network that were not discovered during the preparation of the first and third quarter reports when those reports were submitted. We discovered additional data points that were not previously reported.

During the first and third quarters multiple samples were collected from all the wells in the network due to a miscommunication with the sampling team. The additional samples were not discovered during the preparation of the first and third quarter reports and therefore were not reported. All data are included in this annual report in **Table D**.

In the first quarter, fecal coliform organisms were detected in four samples from two ground water monitor wells (W-35A-04 and W26R-11). Fecal coliform was not detected in any sample results in the third quarter. Also in the first quarter, total coliform organisms were detected in four samples from the same two ground water monitor wells. In the third quarter, no fecal coliform was detected but total coliform organisms were detected in one sample from well W-26R-11.

WDR 96-248 contains a numeric ground water limitation for fecal coliform; the discharge shall not cause the underlying ground water to exceed 2.2 MPN/100mL for two consecutive quarters. LLNL evaluated the results against the limitation. The two data points in the first quarter, 5.1 MPN/100 mL in well W-35A-04 and 23 MPN/100 mL in well W-26R-11, that were above the ground water limit were not repeated in the next sampling event. The initial results from the first quarter samples of 2006, including two samples collected from well W-26R-11, further indicate that the first quarter 2005 results were either not characteristic of the ground water or at worst a transient effect.

LLNL has initiated several responses and corrective actions to this discovery.

- First, upon discovery LLNL collected additional ground water samples for fecal and total coliform from well W-26R-11. The results were total and fecal coliform organisms below the level of detection, that is less than 2 MPN/100mL.
- Second, LLNL has also changed analytical laboratories for the coliform bacteria analyses. Beginning in March 2005, a certified analytical laboratory closer to Site 300 is being used for this work to ensure that the samples can be analyzed as soon as possible after collection. The analytical laboratory is notified in advance of the planned sampling date so that they are ready to analyze the samples as soon as they are delivered. Upon collection of coliform samples, LLNL staff will hand deliver the samples to the analytical laboratory for immediate analysis.

4.0 Percolation Pits

MRP 96-248, Revision 1, requires monthly inspections of the percolation pits at Buildings 806A, 827A, 827C, 827D, and 827E. Sampling and analysis for metals is required whenever an overflow occurs.

During 2005, the percolation pits at Buildings 806A, 827A, 827C, 827D, and 827E operated normally, and no overflows occurred. The percolation pits at both Buildings 827C and 827D contained standing water throughout the fourth quarter.

Acknowledgements

The compliance monitoring program for WDR 96-248 could not be conducted without the dedicated efforts of many people. Duane Rueppel directed the sewage ponds monitoring efforts, and Shari Brigdon directed the monitoring of discharges to the Class II surface impoundments. LLNL sampling technologists sampled the wastewaters, coordinated by Bob Williams, and the monitoring wells, coordinated by Eric Walter, and packaged the samples for shipment to the off-site analytical laboratories. Off-site analytical support was provided by BC Laboratories, Inc., General Engineering Laboratories, and Caltest Analytical Laboratory. Becky Goodrich, Connie Wells, and Hildy Kiefer performed quality reviews and data table preparation. Monique de Vasconcelos provided essential administrative assistance. We thank James Lane, John Scott, Karen Folks, and Larry Paukert at Site 300 for their cooperation in this effort. A draft of this report was reviewed by LLNL peers, whose suggestions for improvements are incorporated.

Appendix A

Annual Summary Plots and Tables of Surface Impoundments Process Water Monitoring Data

Appendix A

This appendix contains graphical and tabular summaries of the 2005 surface water impoundments influent monitoring. The monitoring requirements of WDR 96-248 began in the fourth quarter of 1996.

Wastewater influent monitoring includes photographic process water from Buildings 801, 823, and 851; the Chemistry Area (Buildings 825, 826, and 827 Complex); and discharges from the Explosives Process Area (Buildings 806, 807, 809, and 817).

Retention tank designations for the photographic process and Chemistry Areas are as follows: 801-R3O1 (old), 801-R3O2 (new), 823-R1U1, 851-R1A1 (photographic process area); and 825-R1A1, 826-R1A1, 827A-R1A1, 827C-R1A1, and 827A-R2A1 (Chemistry Area). Process discharges from the Explosives Process Area are generated from Buildings 806/807 and 817 and are designated as B806/807 and B817, respectively. The plots contain all monitoring data available since LLNL began storing sample results from these retention tanks in 1992. There are no 2005 data for B809 because there have been no operations there since May 2001.

The plots display the pH parameter and concentrations of trace metals, volatile organic compounds, and semi-volatile organic compounds in wastewater influent to the surface water impoundments. The plots begin with the retention tank associated with the lowest building number for each detected analyte always plotted first. Only analytes detected in each retention tank are plotted.

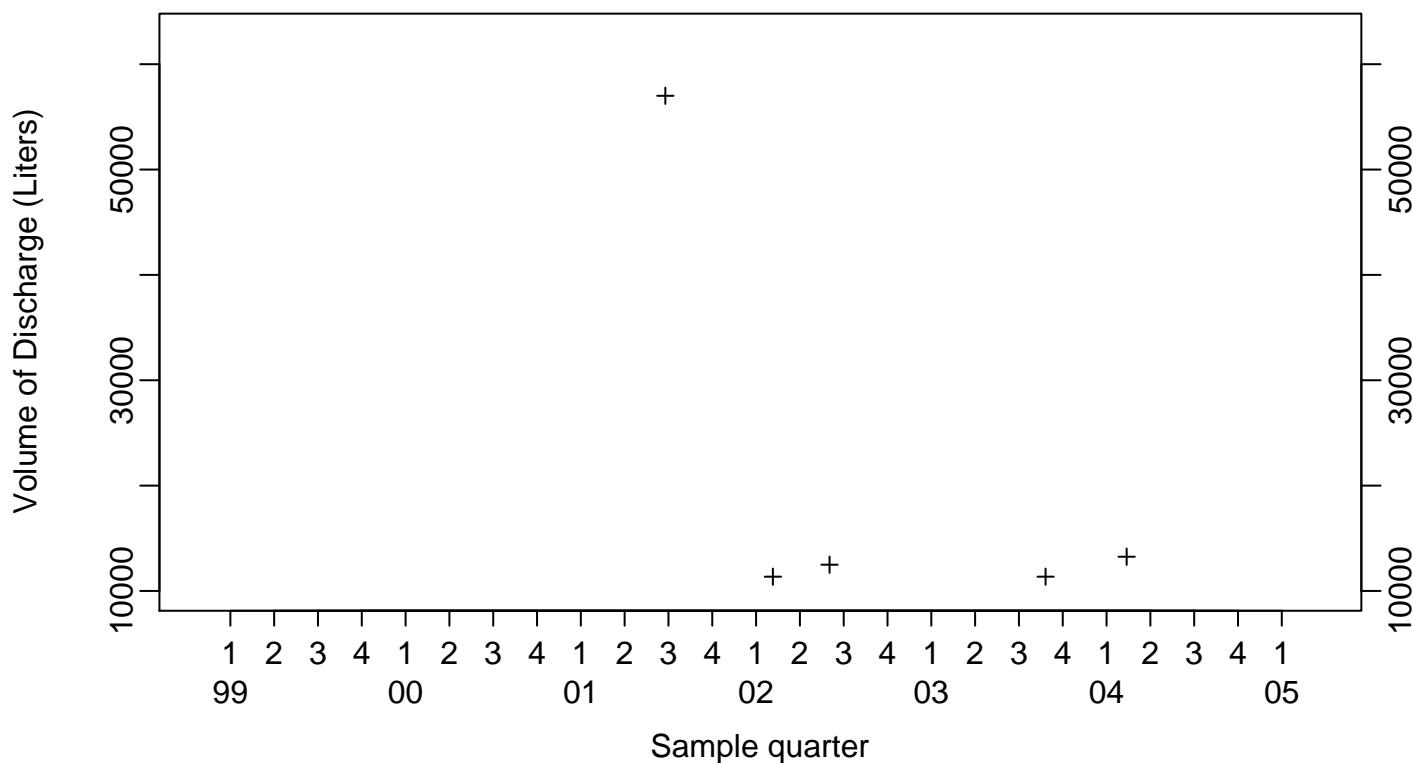

Each two-dimensional graph plots concentration on the vertical axis versus time (years divided into four quarterly sampling periods) on the horizontal axis. Units of measure are given on the vertical axis label and in the header at the top of each page. Values above the analytical reporting limit for each analyte are plotted as solid diamonds, values below the reporting limit are plotted as open inverted triangles, and the estimated values between the reporting limit and method detection limit are plotted as crosses.

Appendix B

Annual Summary Plots and Tables of Surface Impoundments Ground Water Monitoring Data

Appendix B

This appendix contains graphical and tabular summaries of ground water monitoring data from the surface impoundments ground water monitoring network. The constituents of concern for WDR 96-248 are shown graphically, and the tables at the end of this appendix list all 2003 ground water data. The data plots contain all monitoring data available since LLNL began sampling wells W-817-01, W-817-02, W-817-03, and W-817-04 in 1985.

These plots display the field parameter of ground water elevation, followed by volatile organic compounds (VOCs), trace metals, photographic chemicals (cresols), minerals and nutrients, energetic compounds, and finally, semi-volatile organic compounds (SVOCs). The upgradient (background) monitoring well W-817-01 is always plotted first for each analyte.

Each two-dimensional graph shows concentration plotted on the vertical axis versus time (years divided into four quarterly sampling periods) on the horizontal axis. Units of measure are given on the vertical axis label and in the header at the top of each page. Values above the analytical reporting limit for each analyte are plotted as solid diamonds, values below the reporting limit are plotted as open inverted triangles, and estimated values between the reporting limit and the method detection limit are plotted as crosses. The current statistical limits (SLs) for constituents of concern specified in WDR 96-248 are shown as horizontal dashed lines on the graph.

In order to provide more useful plot scales, some analytes at high concentrations are not plotted. **Table B-1.0** shows those concentrations. Some pre-1990 non-detection results have also been omitted from the plots.

Table B-1.0. Ground water analytes that are not plotted.

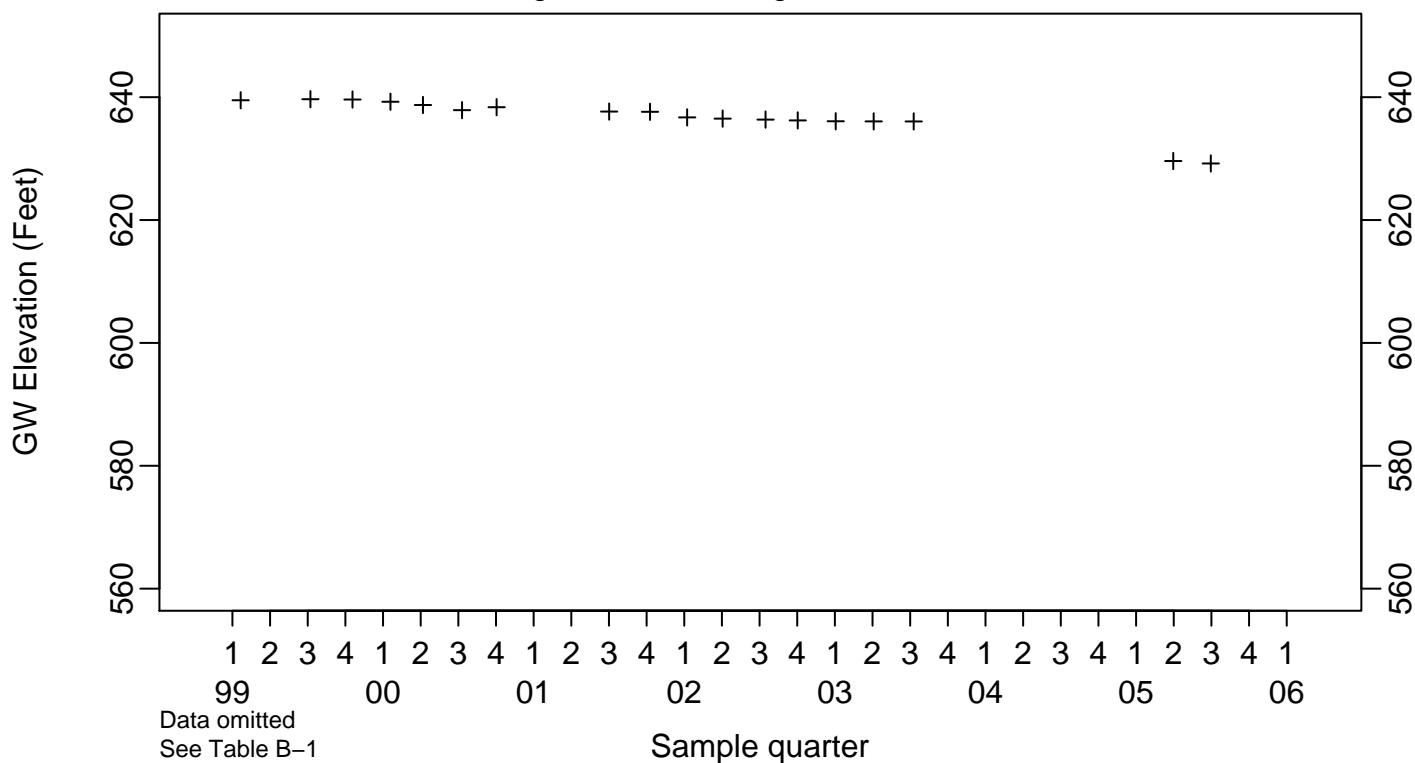

Type	Analyte	Location	Date	Result
VOCs	Methylene chloride	W-817-04	07/27/89	3.6 µg/L
Metals	Barium	W-817-01	02/09/87	0.1 mg/L
Metals	Potassium	W-817-03	04/17/89	37 mg/L
Metals	Zinc	W-817-02	02/06/89	1 mg/L
Metals	Zinc	W-817-03	02/06/89	1 mg/L
Metals	Zinc	W-817-03	06/16/99	0.79 mg/L
Metals	Zinc	W-817-04	02/06/89	0.75 mg/L

^a Statistical limit as listed in MRP 96-248, Table 5, modified by CVRWQCB letter (Cohen 1998) dated September 25, 1998.

^b NA = Not applicable.

^c Results followed by an "est" have estimated concentrations between the MDL and the reporting limit for that analyte.

^d The exceedance of the SL was not confirmed by either of two retest sample results.

^e The analytical results for bis(2-ethylhexyl)phthalate were contaminated as shown by detections in both the field blank and in the method blank samples.

^f The exceedance of the SL was confirmed by two retest sample results.

^g The analytical results for the retest samples collected and analyzed for ammonia nitrogen confirmed the statistically significant evidence for a release of that compound. For each detection of ammonia, however, there was corresponding contamination in the field blank samples, thus making these detections suspect.

^h The analytical result reported for PETN in well W-817-01 was not confirmed by the analytical results for the collocated sample collected from the same well on the same day.

^a MDL = Method detection limit.^b NA = Not applicable.^c No other volatile or semi-volatile organic compounds (other than those listed in **Table B-1.2**) were detected by EPA Methods 624 and 625.^d Results followed by an "est" have estimated concentrations between the MDL and the reporting limit for that analyte.

Appendix C

Annual Summary Plots and Tables of Sewage Evaporation and Percolation Ponds Wastewater Monitoring Data

Appendix C

This appendix contains graphical and tabular summaries of the 2005 sewage evaporation and percolation ponds wastewater monitoring data. The monitoring requirements of WDR 96-248 began in the fourth quarter of 1996. LLNL collected data at the sewage ponds wastewater network prior to the permit issuance in the third quarter of 1996; these data are also plotted.

Wastewater influent monitoring at location ISWP consists of pH, electrical conductivity (EC), and biochemical oxygen demand (BOD). Routine wastewater monitoring at location ESWP consists of pH, EC, and dissolved oxygen (DO); BOD was also analyzed only during the first quarter of 2005. A continuous discharge from the sewage evaporation pond into the percolation pond at location DSWP began in January and continued through the first quarter of 2005. Samples of the continuous discharge were collected on January 3 and March 9, 2005, and analyzed for pH, EC, BOD, nitrate, and fecal and total coliform bacteria.

Each two-dimensional graph plots concentration on the vertical axis versus time (years divided into four quarterly sampling periods) on the horizontal axis. Units of measure are given on the vertical axis label and in the header at the top of each page. Values above the analytical reporting limit for each analyte are plotted as solid diamonds, and values below the analytical reporting limit are plotted as open inverted triangles. Data determined not to be valid are not plotted. Also those concentrations of fecal and total coliform bacteria greater than 1,000,000 most probable number (of organisms)/100 mL of sample are not plotted; those values are as follows listed in **Table C-1**:

Table C-1. Wastewater analytes that are not plotted.

Type	Analyte	Location	Date	Result (MPN ^a /100 mL)
Coliform bacteria	Fecal	3-ISWP-OW	12/01/99	>1,600,000
Coliform bacteria	Fecal	3-ISWP-OW	02/17/00	>16,000,000
Coliform bacteria	Fecal	3-ISWP-OW	05/23/00	3,500,000
Coliform bacteria	Fecal	3-ISWP-OW (dup)	05/23/00	1,700,000
Coliform bacteria	Total	3-ISWP-OW	02/17/00	>16,000,000
Coliform bacteria	Total	3-ISWP-OW	05/23/00	3,500,000
Coliform bacteria	Total	3-ISWP-OW (dup)	05/23/00	3,500,000

^a MPN = Most probable number (of organisms)

Tabular summaries of the observations are contained in **Tables C-2 to C-5**, starting on page C-20.

Appendix D

Annual Summary Plots and Tables of Sewage Evaporation and Percolation Ponds Ground Water Monitoring Data

Appendix D

This appendix contains graphical and tabular summaries of ground water monitoring data from the sewage ponds ground water network. These plots contain all monitoring data available since LLNL began sampling from upgradient ground water monitoring wells W-7E, W-7ES, and W-7PS; from cross-gradient ground water monitoring well W-35A-04; and from downgradient ground water monitoring wells W-26R-01, W-26R-11, W-26R-05, W-25N-20, and W-7DS in 1987.

The plots display field parameters of ground water elevation, pH, electrical conductivity (EC), total coliform bacteria, fecal coliform bacteria, and finally nitrate (as NO₃). The upgradient (background) monitoring wells W-7E, W-7ES, and W-7PS are always plotted first for each analyte.

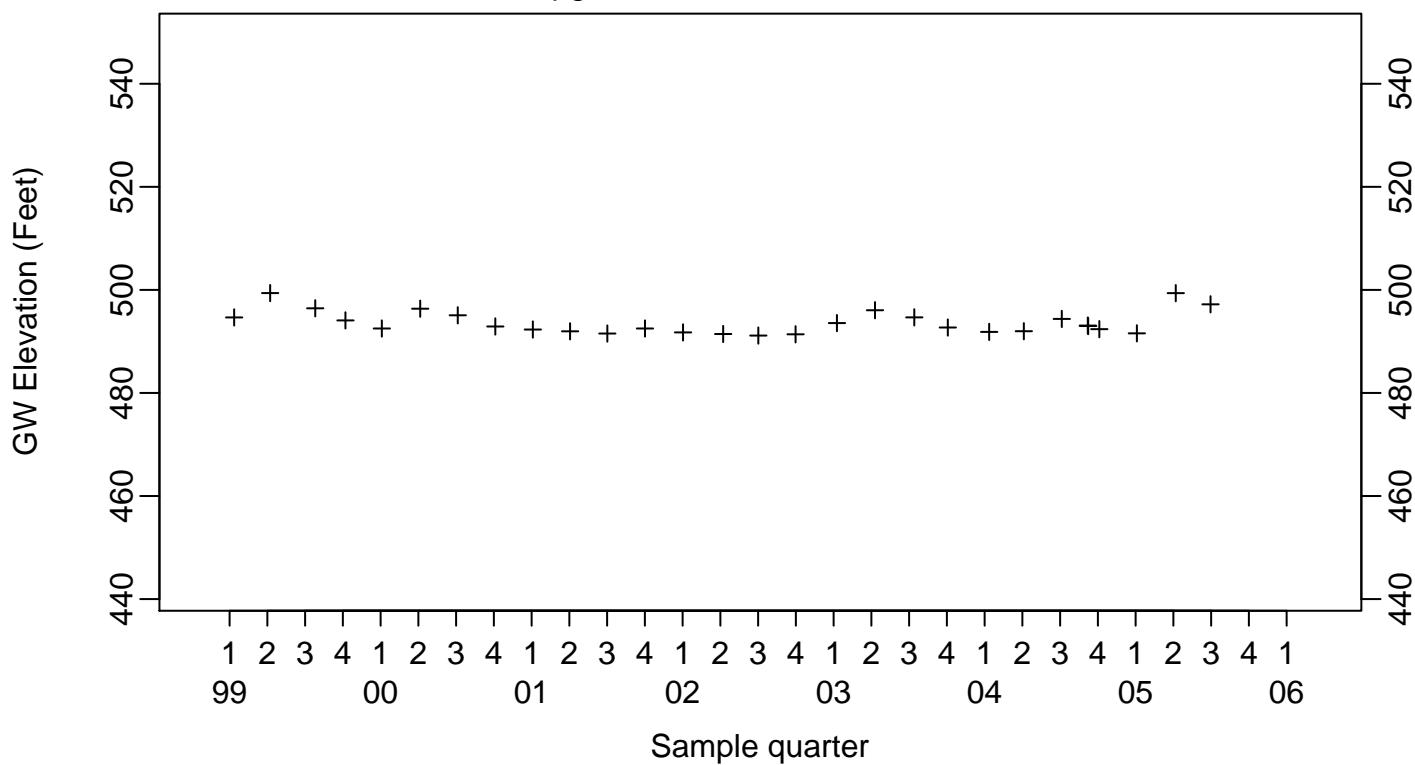

Each two-dimensional graph shows concentration plotted on the vertical axis versus time (years divided into four quarterly sampling periods) on the horizontal axis. Units of measure are given on the vertical axis label and in the header at the top of each page. Values above the analytical reporting limit for each analyte are plotted as solid.

^e Fecal coliform result above the Permit Limit of 2.2 MPN/mL was followed within 6 days by a retest sample with analytical result below the Permit Limit.

^f Reporting limit for coliform increased to 2 MPN for samples sent to different analytical laboratory after March 1.

^g Duplicate (or collocated) sample result.

Appendix E

Statistical Analyses for Ground Water Data

Appendix E

Statistical Analyses

Statistical Methods

Statistical methods are used to detect increases in concentrations of COCs that may indicate releases of COCs to ground water. The CVRWQCB *Standard Provisions* (1993) accompanying WDR 96-248 require the use of statistical methods from the *California Code of Regulations* (CCR), Title 23, Chapter 3, Subchapter 15.

Two statistical methods, prediction intervals and control charts, are used to generate concentration limits and statistical test limits (SLs) for COCs in ground water samples from the surface impoundments monitoring network. Both methods are sensitive in indicating COC concentration increases, and both methods require only one sample per monitoring well for each COC per quarter. Prediction intervals are used when COC concentrations are statistically similar in each of the three down gradient wells to those in the upgradient well, W-817-01. The method of control charts is used when COC concentrations in the downgradient wells are statistically different from those in the upgradient well. A COC is considered to have exceeded its concentration limit when a single ground water analytical result exceeds its SL and either of two subsequent re-tests also exceeds the SL (see **Table B-1.2**). **Table E-1** provides a summary and status of the reported COCs that have shown statistically significant evidence of release.

Table E-1. Reported COCs showing statistically significant evidence of release.

Constituent	Date first reported	Monitor wells	Status of investigation
Zinc	1/9/97	W-817-02, W-817-03	In progress, CERCLA
Chloride	2/7/97	W-817-03	Complete

Fourth Quarter

Quality Assurance/Quality Control

Monitoring Data Discussion,

Surface Impoundments Monitoring Networks

Appendix F

Quality Assurance/Quality Control

1.0 Quality Assurance (QA) Program

To ensure data quality, LLNL utilizes an extensive written set of protocols and procedures that covers all aspects of ground water and surface water sampling, sample tracking, and environmental data management. The *LLNL Livermore Site and Site 300 Environmental Restoration Project Standard Operating Procedures* (Goodrich and Depue, 2004), and the *Environmental Monitoring Plan* (Althouse *et al.*, 2002) form the set of written instructions to be followed. Observing these protocols prevents inadvertent sample contamination and maintains sample integrity from the sampling location to the analytical laboratories. Data management procedures ensure that all laboratory measurements are received, accurately recorded, and properly stored in a computer database for easy and fast retrieval. Hard copies of the data are also archived. All sample analyses for the surface water impoundments meet the reporting criteria delineated in the Permit as modified by Wendy Cohen of CVRWQCB on September 25, 1998 (Cohen, 1998) (**Tables F-1.1 through F-2.2**).

1.1 Field Procedures

As a part of the QA program, data quality for the sampling activities during each quarter is assessed by the following method: field blanks use analyte-free water for the analyses of organic compounds and high-performance liquid chromatography (HPLC)-grade water for all other required analyses. Field blanks, which are prepared at monitor wells and wastewater sample locations chosen at random, are analyzed for parameters identical to those for the routine samples. Field blank data are reviewed by analysts to determine whether contamination has been introduced into the samples as a result of field conditions or sample handling procedures.

1.1.1 Process Wastewater Influent

Field QA procedures include adherence to the *Environmental Monitoring Plan* (Althouse *et al.*, 2002). These include approved procedures for: sample preparation, handling, preservation, custody, and equipment decontamination procedures. Field activities are recorded on field tracking forms and/or in logbooks, and sample tracking is maintained through the chain-of-custody process. Field QA protocols include the preparation of at least 10 percent duplicate or collocated samples. The purpose of field duplicates is to verify the precision and comparability of the sampling activity. Additionally, temperature blanks are included in each shipping container of samples to verify that the temperature is maintained at $4^{\circ} \pm 2^{\circ}$ Celsius until receipt at the analytical laboratories.

1.1.2 Ground Water Monitoring

Field QA procedures include adherence to the sampling and analysis protocols of the *LLNL Livermore Site and Site 300 Environmental Restoration Project Standard Operating Procedures* (Goodrich and Depue, 2004). These include approved procedures for: sample collection, preparation, handling, preservation, custody, and equipment decontamination procedures. Field activities are recorded on field sampling sheets and/or in logbooks, and sample tracking is maintained through the chain-of-custody process. Field QA protocols include the preparation of at least 10 percent duplicate or collocated samples. The purpose of field collocated samples is to verify the precision of the sampling and analysis activities. Significant differences between duplicate samples (which should have identical results within the margin of sampling and analytical errors) are investigated by the responsible analysts, in collaboration with an LLNL quality control chemist. Field blanks are prepared at random locations to assess sample hygiene and handling practices.

1.2 Analytical Laboratories

LLNL contracts with several outside analytical laboratories. They provide routine analytical services that meet the requirements of LLNL's QA documents, as well as the requirements cited in the Permit. Analytical laboratories used by LLNL and each laboratory's responsible person are:

- BC Laboratories, Inc.
4100 Atlas Court
Bakersfield, CA 93308
Laboratory Responsible Person: Julianne Gauss
- Caltest Analytical Laboratory
1885 N. Kelly Rd.
Napa, CA 94558
Laboratory Responsible Person: William Svoboda
- General Engineering Laboratories
P.O. Box 30712
2040 Savage Road
Charleston, SC 29414
Laboratory Responsible Person: Cheryl Jones
- Sequoia
885 Jarvis Drive
Morgan Hill, CA 95037
Laboratory Responsible Person: Lisa Race

These laboratories perform extensive quality control analyses including: method blank analyses, analyses of laboratory control samples (LCS), matrix spike (MS), and matrix spike duplicates (MSD), and analyses of surrogate samples for organic compounds.

Additionally, these laboratories provide data reports of tentatively identified compounds (TICs) for volatile and semivolatile organic compounds (VOCs and SVOCs), analyzed by gas chromatography/mass spectroscopy, and provide estimated concentrations. (TICs are currently reported in the data tables of this report.) Each of these laboratories is accredited by the California Department of Health Services for the analyses performed. Résumés of the analysts' education and qualifications are available through each laboratory.

2.0 Quality Assurance and Quality Control Results

2.1 *Process Wastewater Influent*

No process wastewater was discharged into the surface impoundments during the fourth quarter, so that there is no field QA/QC data discussed in this section.

2.2 *Ground Water Monitoring*

Analyte concentrations of routine and duplicate samples collected from up gradient monitor well W-817-01 are in very good agreement for the COCs detected above their respective reporting limits (**Table F-2.1**).

No COC or non-COC compounds were detected in method blank samples above laboratory reporting limits during the fourth quarter (**Tables F-2.1** and **F-2.2**). Of the COCs, only dissolved zinc (0.014 mg/L) was detected in a field blank sample at concentration that could potentially be of regulatory significance (**Table F-2.1**). The concentration of 0.014 mg/L of dissolved zinc detected in the field blank sample indicates that the concentrations detected in the ground water samples collected from all four wells might be biased high due to field contamination. However, this is not a significant issue for zinc because concentrations in the down gradient wells did not exceed any SL for zinc. Recoveries for all LCS samples and for all MS and MSD samples are within laboratory acceptance limits, so that these data meet all requirements for data accuracy as well as precision.

Laboratory QA/QC (i.e., MS/MSD and LCS) data associated with all ground water samples and evaluated per EPA Functional Guidelines for data review (U.S. Environmental Protection Agency, 1994a and 1994b), showed all parameters within acceptable ranges for data usability.

During 2005, the COC bis(2-ethylhexyl)phthalate has been detected in ground water samples from all four monitor wells at concentrations close to the reporting limit (also the SL) of 5 µg/L. It has also been detected in method blank and field blank samples analyzed by the laboratory at approximately the same concentrations. Those concentrations of bis(2-ethylhexyl)phthalate in the routine fourth quarter ground water samples collected from all four monitor wells were likely biased high due to the detectable presence of the COC in both the method blank and field blank samples (see also **Table F-2.1**).

Table F-1. Detections of bis(2-ethylhexyl)phthalate in 2005 ground water and blank samples.

Table F-2.1. Ground water field QA/QC results, constituents of concern required by WDR 96-248 (concluded).

Monitoring well W-817-01	MDL ^a	Reporting limit	Routine sample	Duplicate sample	Field blank sample	Method blank sample
Energetic materials ($\mu\text{g/L}$)						
HMX	0. 0649	0. 649	14. 5	14. 5	<0. 649	<0. 649
RDX	0. 13	0. 649	37. 6	36. 1	<0. 649	<0. 649
TNT	0. 13	0. 649	<0. 649	<0. 649	<0. 649	<0. 649
TATB	1. 4	20	<20	<20	<20	<20
PETN	0. 325	1. 3	<1. 3	<1. 3	<1. 3	<1. 3
Tetryl	0. 162	0. 649	<0. 649	<0. 649	<0. 649	<0. 649
4-amino-2,6-dinitrotoluene	0. 13	0. 649	7. 40	7. 69	<0. 649	<0. 649

^a MDL = Method detection limit.

^b NA = Not applicable.

^c Results followed by an "est" have estimated concentrations between the MDL and the reporting limit for that analyte.
